Ball mill

JXSC Mine Machinery Factory
www.jxscmachine.com
Heavy-duty ball mill machines are designed for long life and minimum maintenance.

The ball mill is used for grinding materials such as coal, pigments, and feldspar for pottery. Grinding can be carried out either wet or dry but the former is performed at low speed.

Variations of the standard designs are available to suit any appropriate application. These may include but not be limited to: grate discharge, peripheral discharge, dry grinding, special length to diameter ratio, high temperature milling operations, or pebble milling.
**Application**

A ball mill grinds ores and other materials to a typical product size of 35 mesh or finer.

The feed to a ball mill is prepared by:

- Single or multistage crushing and screening
- Crushing, screening, and/or rod milling
- Primary crushing and autogenous/semiautogenous grinding

Normal feed sizes:

- 80% passing 1/4” (6 mm or finer) for hard ores
- 80% passing 1” (25 mm or finer) for soft ores

(Larger feed sizes can be tolerated depending).

The length to diameter ratio of cylindrical mills range from 1 to 1 through 3 to 1. When the L/D ratio is 2 to 1 or greater, we refer to the mill as a Tube Mill.
Application

Ball Mill

Materials

(etc.)

Iron ore
Quartz Sand
Basalt

Ceramics

Finished Products

(etc.)

Building Material
Silicate Product
Fertilizer

Grinding circuit design

JXSC process engineers welcome the opportunity to assist you with circuit and circuit control design as well as start-up, operation, and optimization of the milling plant.

Ball mills operate either in open or closed circuit. Open circuit operation is best utilized when:
• Another stage of grinding follows the mill
• Reduction ratio is small
• Feed material is already fine and one pass through the mill produces the desired results
• Product size control is not critical and oversize material can be tolerated in the product.

Where size control of the final product is important, closed circuit grinding is the most efficient method of operation. The production of a higher quality product at a lower cost justifies the additional capital investment. Common wet grinding flow sheets include:
• Open circuit
• Closed circuit with hydro cyclones
• Closed circuit with vibrating screens
• Two stage variations of the above utilizing two mills in series

JXSC Mine Machinery Factory history

- **1985**: JXSC factory established
- **2002**: Enter the worldwide market started exporting
- **2012**: Expand 3000m2 workshop ISO certified
- **2017**: Exported more than 40 countries
- **2019**: A new factory is under construction
